Project Demonstration Rubric

	Excellent	Good	Pass	Fail
Subject knowledge	Demonstrates a deep understanding of the research, including a clear explanation of key concepts. Clearly understands the strengths and limitations of the project. Defends research confidently and precisely.	Demonstrates a good understanding of the project. Can communicate the objectives and results clearly. Understands the limitations of the research. Defends questions well.	Demonstrates some understanding of the project. Provides a basic explanation of subject matter with little elaboration or reasoning.	Inability to demonstrate a good understanding of the project. Explanation is inaccurate or irrelevant. Inability to successfully defend research.
Organisation	Main points explained clearly, distinct from supporting details. Clear and precise organizational pattern.	Research presented consistently and logically. Main points are distinct from supporting details.	Research presented somewhat consistently and logically, though distinction between main points and supporting details is blurred.	Research presented in an inconsistent and illogical manner. Apparent inaccuracies throughout the demonstration.
Demonstration	Implementation functionality required to meet project requirements has been implemented fully. Additional functionality demonstrated above the initial project requirements.	Implementation functionality required to meet project requirements has been implemented adequately, though may require some improvement.	Implementation shows basic functionality, though some components not implemented or are incomplete such that project requirements are not fully met.	Implementation does not function or is poorly designed. Demonstration does not clearly show the strengths/ aims of the research.
Testing and evaluation	Research thoroughly and rigorously tested. Evaluation methods are clear and reproducible.	Sufficient testing and evaluation methods demonstrated. Methods identify the strengths and weaknesses of the research.	Some testing carried out, though not rigorously. Some aspects of the research are not validated.	Implementation is not tested for robustness. Research methods are not validated.
Complexity	Research/ implementation complexity extends far beyond theory/ skills learned in modules. New or novel research that makes a clear contribution to area of study.	Evidence of expanding or building upon a core idea/ theory. Demonstration of learned skills/ knowledge beyond what was covered in module theory.	Implementation complexity is indicative of module-level assessments or theory. No novel purpose or functionality implemented.	System or research presented is too simplistic. Implementation does not carry out the aims set out in the thesis.
