Lab 2 FAQ

Q. Part 1 Step 1 My **ssh -l SSHadmin 192.168.1.1** command will not work??
A. You are using "-1" instead of "-l" (i.e. the lowercase letter L).

Q. Part 3 Step 2 I'm pretty sure I have the rules all correct in ACL 105 but Packet Tracer is not giving the marks for it?
A. Try checking the following:
- Have you definitely used the correct protocol (udp or tcp) and port numbers? See the appendix at the end of the lab instructions for the correct ones to use.
- Have you put in all of the rules **in the same order that it asked them**? It is expecting the 5 rules in the order it listed them (i.e. First DNS, then SMTP, then FTP, then HTTPs and finally the rule for SSH).
- For the last rule in the ACL (SSH access for Admin to R1), remember to make sure you have used the IP address of S0/0/0 on R1 (i.e. the closest interface to Admin on R1).

Q. Part 4 Step 2 I'm pretty sure I have the rules all correct in ICMP_ACL but Packet Tracer is not giving the marks for it?
A. Again, make sure you have included the rules in the same order they were asked. (Hint 1: There are 4 rules in total). Also, for the "destination unreachable" messages, you want to ensure **all** of the unreachable messages are included (Hint 2: use "permit icmp any any ?" to see the available options and chose the one that includes all unreachable messages).

Q. Part 6 Step 1 I'm pretty sure I have the rules all correct in ACL100 but Packet Tracer is not giving the marks for it?
A. Make sure you have definitely included all of the rules for the private addresses, local host & broadcast address are they are correct (see slide 46 for help). Also, double check they are definitely in the right order.
