

Lab Handout: Fixing the Error

"The feed owner is currently not set. This issue may be due to the feed not having completed its synchronization."

Overview

In Greenbone Vulnerability Management (GVM), certain configuration objects—Scan Configs, Port Lists, Report Formats—are downloaded from the Greenbone feed and must be imported into the gvm database. For gvm to import these objects, it must know which user will own them. This user is called the Feed Import Owner. If the owner is not set, the system cannot complete the import process, resulting in errors such as:

"The feed owner is currently not set. This issue may be due to the feed not having completed its synchronization. Please try again shortly."

Or when rebuilding data:

"Failed to rebuild gvm data: Feed owner not set or invalid while rebuilding configs"

This document explains how to identify and fix the issue.

Why This Error Occurs

- GVM requires a Feed Import Owner to be set before feed-provided objects can be written to the database.
- If this value is missing, gvm cannot import Scan Configs, Port Lists, etc.
- This results in task creation failure, missing scan configs, and the error above.

Step-by-Step Instructions

1. Retrieve User UUIDs

Run the command:

```
sudo -u _gvm gvm --get-users --verbose
```

You will see output similar to:

```
admin 99d19126-0e8c-412d-b3f9-48c8ea0c648f
```

or the username that you created when you did the OpenVAS installation.

The UUID next to the username is the value needed in later steps.

2. Set the Feed Import Owner

Use the fixed setting ID for Feed Import Owner:

```
78eceaec-3385-11ea-b237-28d24461215b
```

Set the owner using:

```
sudo -u _gvm gvmc --modify-setting 78eceaec-3385-11ea-b237-28d24461215b --value  
<UUID>
```

Example:

```
sudo -u _gvm gvmc --modify-setting 78eceaec-3385-11ea-b237-28d24461215b --value  
99d19126-0e8c-412d-b3f9-48c8ea0c648f
```

3. Rebuild gvmc Data

Run:

```
sudo -u _gvm gvmc --rebuild-gvmc-data=all
```

If successful, the error is resolved.

If you see “NVTs must be available while rebuilding configs,” it means the scanner has not finished loading Vulnerability Tests.

4. Verify the Fix

A. Rebuild completes without errors.

B. Creating a Task no longer produces the error.

Troubleshooting

1. If rebuild still reports missing Feed Owner: verify that you used the correct UUID.

2. If NVTs are not loaded, run:

```
sudo -u _gvm greenbone-feed-sync --type nvt
```

Summary

To repair the error:

1. Get admin UUID.
2. Set Feed **Import** Owner.
3. Rebuild gvm data.
4. Verify results.

Reference

This Fix has been based on information contained in the following article - [Setting up GVM11 - Alpine Linux](#)
